Intentional Self-Harm (suicide)	10.9
Chronic Liver Disease and Cirrhosis.....	9.0
Infant Mortality	6.87

Notes:

1 Only one year of U.S. data are given to compare with five years of state and county data because the numbers on the national level are much greater and do not fluctuate as much annually.

2 The U.S. percent of mothers receiving care in 1st trimester is based on 37 states due to lack of comparable data from the remaining states.

3 Data for mothers who used tobacco while pregnant are self-reported. The U.S. percent of mothers who used tobacco is based on 36 states due to lack of comparable data from the remaining states.

4 Teenage pregnancy rate is live births, fetal deaths, and abortions per 1,000 females age 15-17. The U.S. teenage pregnancy rate is from 2004.

5 The mortality rates, except infant mortality are age-adjusted death rates per 100,000 population. Age-adjusting to the standard million population eliminates differences between populations, making them easier to compare. Infant mortality is calculated as the number of infant (less than one year old) deaths per 1,000 live births.

** Atherosclerotic Heart Disease I25.1 was not broken out in the national data; therefore no age-adjusted rate is displayed.
